

# Release Liquid Mineral

## LEES ALTERNATIVES

Persistence, fresh taste and reduced bitterness

### Oenological applications

**Release Liquid Mineral** is a solution based on selected manno-proteins which enhances aromatic persistence and brings out the fresh taste of wines. It also helps diminish aggressive sensations such as bitterness or astringency.

### Dosage and implementation

- 2 to 15 cL/hL.

It is preferable to carry out prior tests in bottles to optimize treatment dosage and judge its effect. After incorporating, mix in well with the wine by pumping over or stirring, but without oxygenating. Once totally soluble,

**Release Liquid Mineral** is added directly to the wine.

Its instantaneous effect means that wine can be treated immediately prior to bottling.

In order to avoid any risk of cloudiness, however, it is recommended that **Release Liquid Mineral** be added 24 hours prior to filtration before bottling. It is also preferable to carry out a wine filterability laboratory test with the chosen dosage before using the product in the total volume of wine.

Reminder: before tangential microfiltration, it is generally considered that the treated wine should have the following characteristics: blocking index<10 and cloudiness<1 NTU.

For wines vinified using the traditional method, **Release Liquid Mineral** should be introduced directly into the dosage liqueur before dispersal.

### Characteristics

- Mannoproteins origin: *Saccharomyces cerevisiae*.
- Preservative: E220 SO<sub>2</sub> (<0.25%).

**Release Liquid Mineral** does not induce gushing.

### Packaging and conservation

- 1L, 5L

To be stored in a dry, odour-free place, between 5 and 25°C. Once the bottle is opened, the product must be used quickly and cannot be preserved.
